

Linear Bushing

LBE/LBD/LBB/LM/LME/LMB

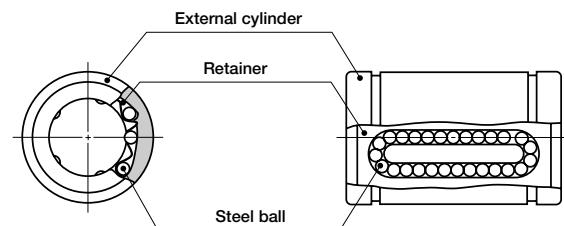

IKO Linear Bushing is a high precision linear motion rolling guide which travels along a shaft to achieve endless linear motion. In the external cylinder, a retainer, steel balls, etc. are compactly incorporated. Wide variations in size are available for selections suitable for each application.

Low frictional linear motion

Steel balls are accurately guided by a retainer, so low frictional resistance and stable linear motion can be achieved.

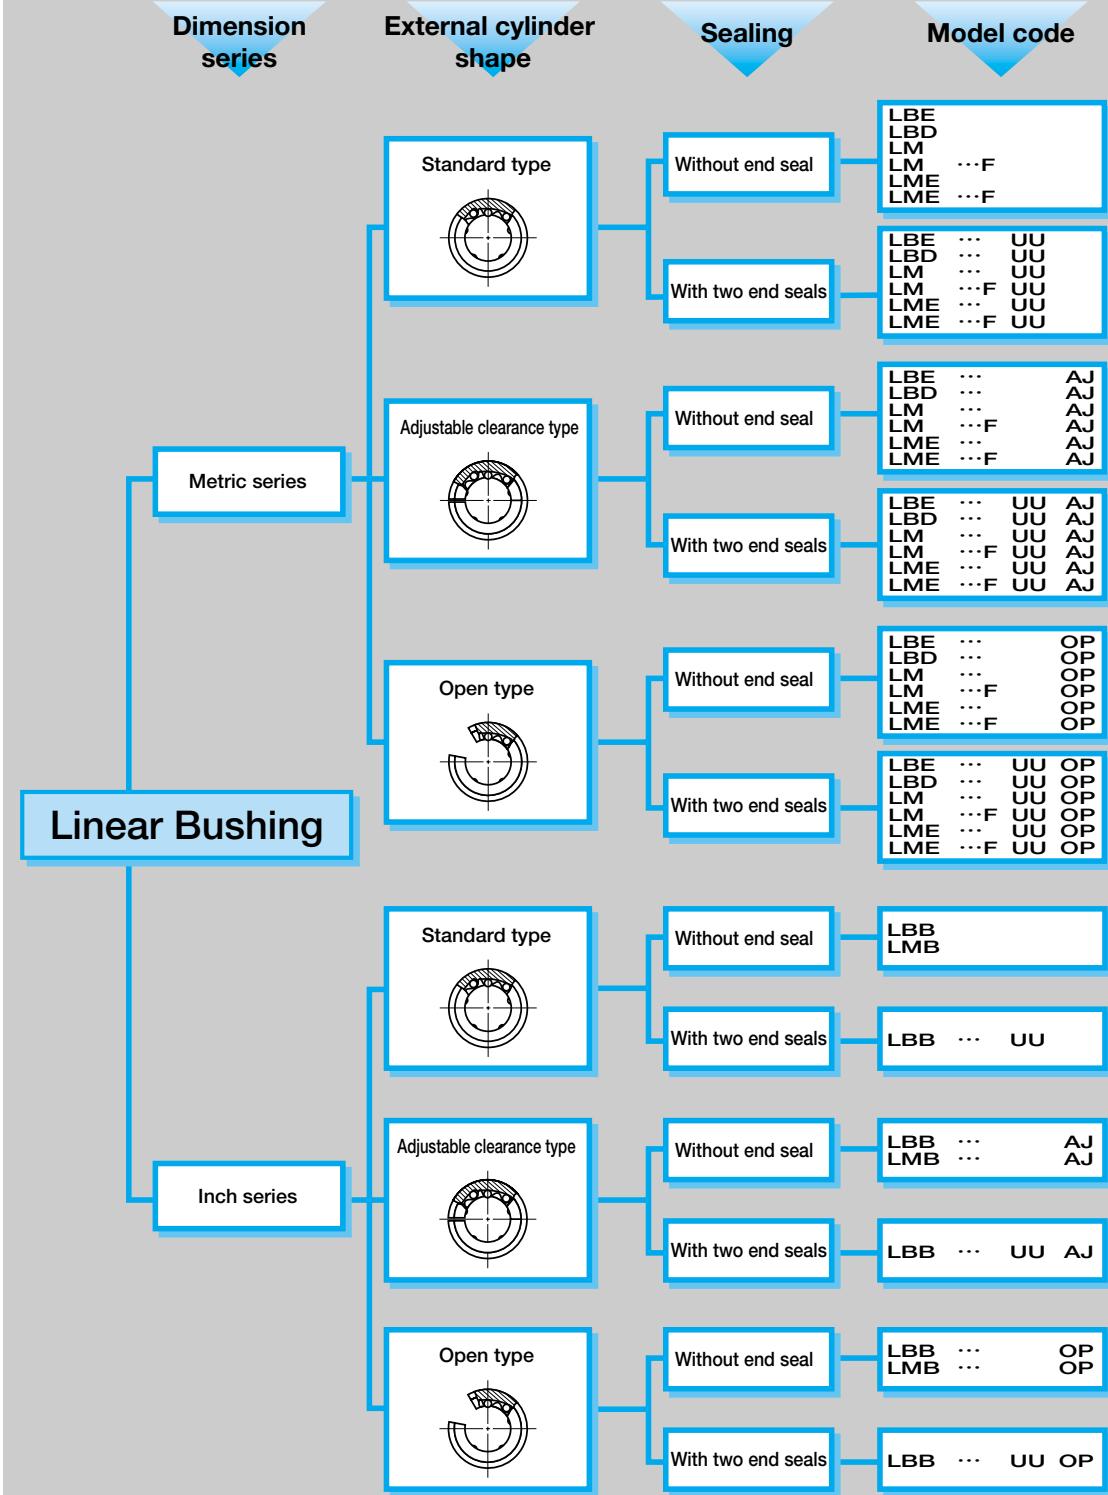

Simple replacement of conventional plain bushings

It is easy to use Linear Bushings instead of conventional plain bushings, because both types are used with a round shaft, and no major redesign is necessary.

Structure of Linear Bushing

Linear Bushing series

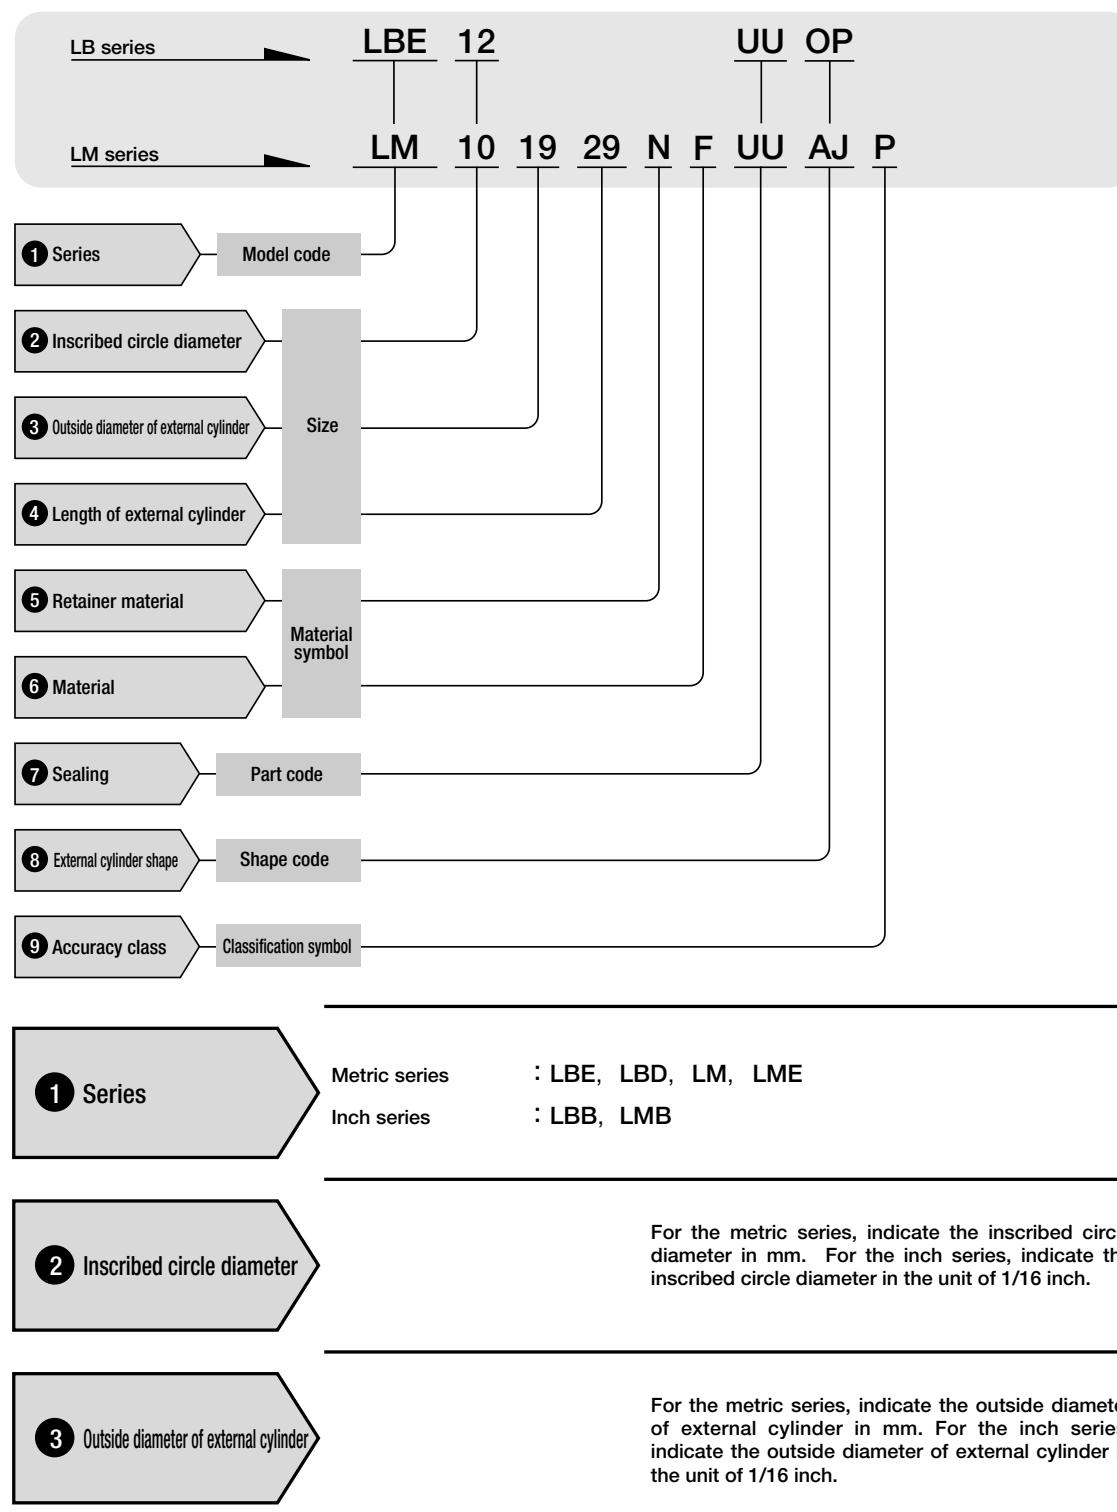

LBE, LBD, LBB, LM, LME, LMB

E

Identification number and specification

The specification of Linear Bushing is indicated by the identification number, consisting of a model code, a size, a material symbol, a part code, a shape code and a classification symbol.

④ Length of external cylinder

For the metric series, indicate the length of the external cylinder in mm. For the inch series, indicate the length of external cylinder in the unit of 1/16 inch.

⑤ Retainer material

Carbon steel made : No symbol
Synthetic resin made : N

In case of LM series, specify the retainer material. For applicable models and sizes, see the "Model number" column in the table of dimensions on pages E-140 to E-173. The maximum operating temperature for the synthetic resin type is 100°C. Continuous operation is possible at temperatures up to 80°C.
In all of LB series, the retainer is made of synthetic resin.

⑥ Material

High carbon steel made : No symbol
Stainless steel made : F

Specify the component part material. For applicable models and sizes, see the "Model number" column in the table of dimensions on pages E-140 to E-173.

⑦ Sealing

Without end seal : No symbol
With two end seals : UU

The two seal types incorporate seals with superior dust protection performance at both ends of the external cylinder for preventing intrusion of foreign matter. The maximum allowable temperature for seals is 120°C.

⑧ External cylinder shape

Standard type : No symbol
Adjustable clearance type : AJ
Open type : OP

See "External cylinder shape" shown below.

External cylinder shape

Standard type

This type is widely used as a general purpose linear guide. High and precision classes are available.

Adjustable clearance type

A slot in a longitudinal direction is made on the external cylinder in order to adjust the clearance. When this type is used with a housing which can adjust the bore diameter, the radial internal clearance can be adjusted without fit selection between the linear bushing and shaft. It is possible to give a preload.

Open type

This type has one or two fewer ball circuits than the standard type, creating an open section to allow clearance for a shaft support.

The open type bushing is commonly used with long shafts when one or more support blocks are needed to reduce shaft deflection or sag. The width of the support blocks can be determined to match the (E) dimension of fan shaped open section shown in the table of dimensions. The radial internal clearance can also be adjusted.

⑨ Accuracy class

High : No symbol
Precision : P

For details of accuracy, see the table of dimensions on pages E-140 to E-173. High class and precision class are available for the LBD, LBB, LM and LMB standard type series.

For the adjustable clearance type and the open type, only high class is available, and the accuracy values are applicable only before cutting the external cylinders.

Load Rating

Summarized descriptions of load ratings of Linear Bushing are given below. For details of load rating definitions and load calculations, see "General description".

● Basic dynamic load rating C

The basic dynamic load rating is defined as the constant load both in direction and magnitude under which a group of identical Linear Bushings are individually operated and 90% of the units in the group can travel 50×10^3 meters free from material damage due to rolling contact fatigue.

● Basic static load rating C_0

The basic static load rating is defined as the static load that gives a prescribed constant contact stress at the center of the contact area between the rolling element and raceway receiving the maximum load.

● Relationships between load ratings and the position of ball circuits

Load ratings of Linear Bushing are affected by the position of the ball circuits. In the table of dimensions, two types of load ratings are shown corresponding to the load directions and steel ball circuit positions as shown in Fig. 1 and Fig. 2.

In Fig. 1 the load direction is in line with the steel ball circuit position and this direction is referred to as load direction A in the table of dimensions. In general, the load ratings for this direction are also used, when the load direction is indeterminate or the steel ball circuit position in relation to the load direction cannot be determined.

In Fig. 2, the load direction is pointed at the center of two ball circuits and this direction is referred to as load direction B in the table of dimensions. In general, a larger load can be received in this case compared with load direction A.

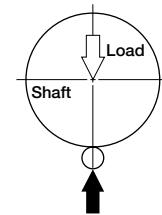

Fig. 1 Load direction A

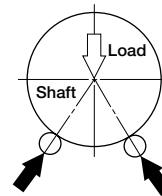

Fig. 2 Load direction B

Precautions for Use

① Clearance

Adjustable clearance and open type Linear Bushings can be adjusted for radial internal clearance if they are used with a housing which can adjust the bore diameter.

However, if the degree of the adjustment is excessive, deformation at the contact points between steel balls and shaft or external cylinder becomes large, resulting in short life. Therefore, it is recommended to prepare a shaft with a specified fit tolerance and adjust the radial internal clearance to zero or minimal preload by matching the individual components.

The clearance is adjusted while checking with a dial gage. The adjustment is generally completed when the shaft is rotated in an unloaded condition and light resistance is caused by the rotation of shaft. In this condition, the radial internal clearance becomes zero or minimal preload. For open type Linear Bushings having three rows of ball circuits, clearance adjustment can not be made.

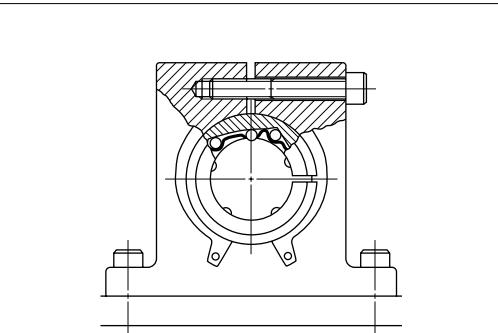

Fig. 3 Example of clearance adjustment

② Raceway surface

Since Linear Bushings operate with a shaft as a raceway surface, the shaft should be heat-treated and ground. Recommended surface hardness and roughness of the shaft are shown in Table 1, and also recommended minimum effective hardening depth of the raceway is shown in Table 2.

Table 1 Surface hardness and roughness of raceway

Item	Recommended value	Remarks
Surface hardness	58~64HRC	When the raceway hardness is less than the necessary hardness, multiply load ratings by the hardness factor.
Surface roughness	0.2μmRa or better (0.8μmRy or better)	When the required accuracy is not severe, a surface roughness of about 0.8μmRa (3.2μmRy) is adequate.

Table 2 Minimum effective hardening depth unit : mm

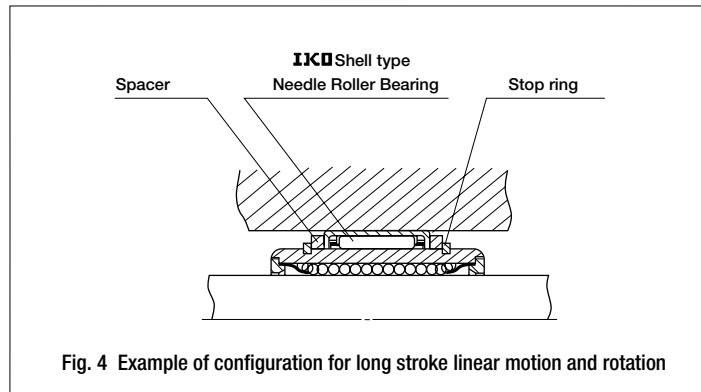

Shaft diameter over	incl.	Recommended minimum effective hardening depth
—	28	0.8
28	50	1.0
50	100	1.5
100	150	2.0

③ Lubrication

Linear Bushings can be used with oil or grease lubrication. A good quality lithium-soap base grease is recommended for grease lubrication.

④ When rotational motion is present

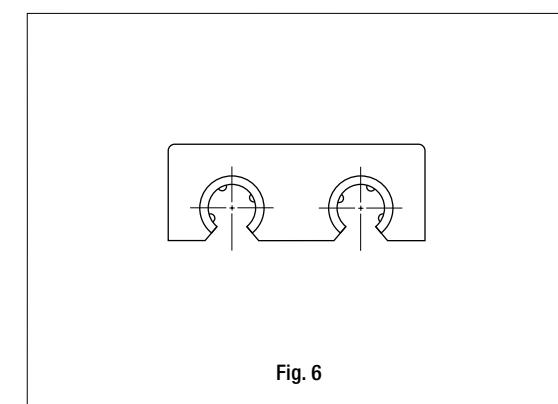

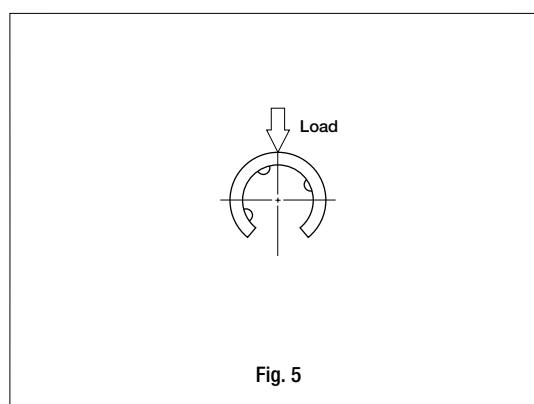

Linear Bushings can only be operated in linear motion and can not be rotated. When linear motion in short stroke length and rotation are both required, IKO Stroke Rotary Bushing (See page E-176.) is recommended. If linear motion in long stroke length and rotation are both required, a combination of Linear Bushing and IKO Needle Roller Bearing as shown in Fig. 4 is recommended.

⑤ Precaution for use of Open type Linear Bushing having three rows of ball circuits

Open type Linear Bushings having three rows of ball circuits can be used only for the load direction shown in Fig. 5. If two Linear Bushings are used in parallel, by considering the load distribution, the arrangement shown in Fig. 6 is recommended.

This type can not be adjusted for radial internal clearance.

Precautions for Mounting

● Fit

Table 3 shows the recommended fit tolerances for Linear Bushing. The fit between Linear Bushing and housing is usually clearance fit. For some special applications, an interference fit may be required. For adjustable clearance or open type Linear Bushings, the following recommendations apply. The shaft diameter is finished smaller than the lower limit of the tolerance range of the inscribed circle diameter of the Linear Bushing, while the housing diameter is finished larger than the upper limit of the tolerance range of the outside diameter of the external cylinder of the Linear Bushing.

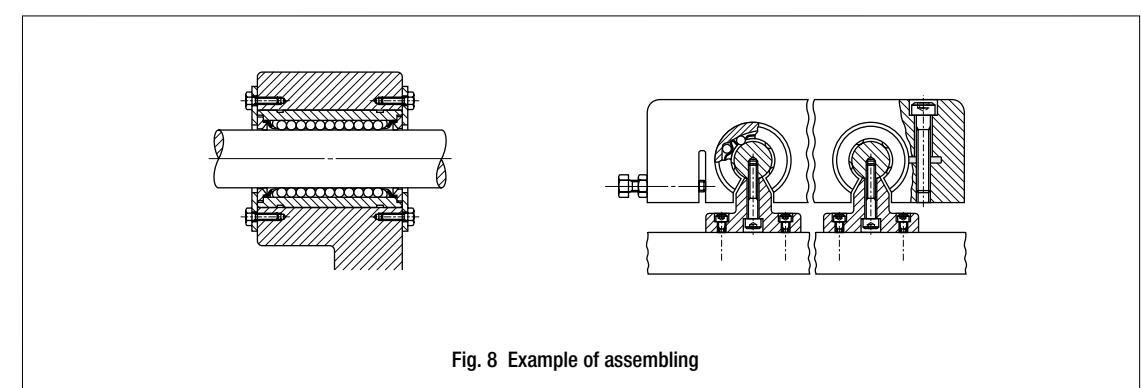

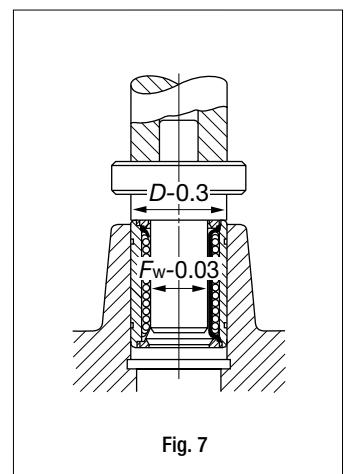

Table 3 Recommended fit tolerance

Type	Item		Shaft		Housing	
			Normal clearance	Closer clearance	Clearance fit	Interference fit
LBD, LBB	High class		f6,g6	h6	H7	J7
LM, LMB	Precision class		f5,g5	h5	H6	J6
LBE, LME	-		h6	j6	H7	J7

● Mounting

When press-fitting the Linear Bushing into the housing, do not hit the end plate. The correct method is to gradually push the external cylinder with a jig for assembling. (See Fig. 7.) Then the external cylinder is fixed in the axial direction with a stop ring or a stopper plate. When inserting the shaft into the Linear Bushing assembled into a housing, gradually and gently insert a shaft avoiding to give impact on the steel balls and retainers.

If two shafts are used in parallel, fix one shaft accurately as a datum shaft and locate the second shaft to the datum shaft keeping the parallelism. Fig. 8 shows an example of general assembling.

Accessories

Steel shaft for Linear Bushing

In order to achieve full performance of Linear Bushing, heat-treated and ground steel shafts with high accuracy are available. Commercial shafts can also be delivered upon request. For details, consult IKO.

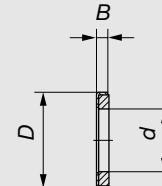

Shaft support block

Support blocks are prepared for supporting the ends of shaft for Linear Bushing. For details, consult IKO.

Felt seals for Linear Bushing

Felt seals are available for Linear Bushing without end seal. If dust protection and minimal frictional resistance in linear motion are both required, felt seals are recommended. Dimensions of felt seals are shown in Table 4.

Table 4 Dimensions of felt seals for Linear Bushing

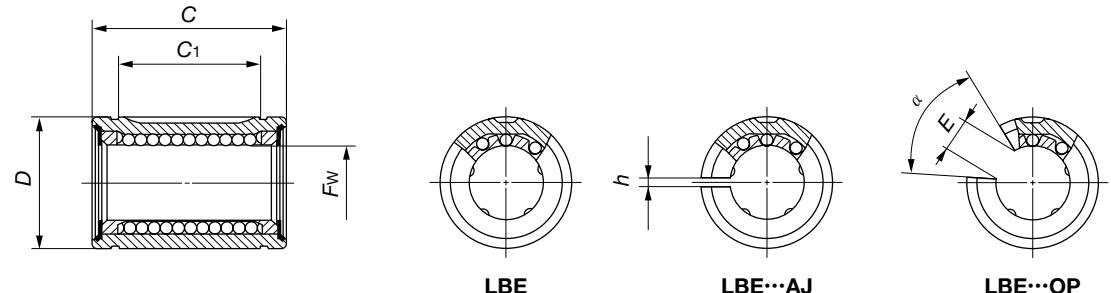

Model number	<i>d</i>	<i>D</i>	<i>B</i>

Note⁽¹⁾ : When circlips are used for mounting, the dimension C₁ minus twice the width of circlip becomes the width of hub.

Remark 1 : In the tolerance and eccentricity columns, "Precision" refers to precision class and "High" refers to high class.

2 : The end plate for the standard type and the adjustable clearance type with a shaft diameter of 40mm or less is fixed using a stop ring for hole.

Note⁽¹⁾ : When circlips are used for mounting, the dimension C₁ minus twice the width of circlip becomes the width of hub.

(²) : The load rating for three rows of ball circuits is shown as a representative value.

Remark : In the tolerance and eccentricity columns, "Precision" refers to precision class and "High" refers to high class.

IKO Compact Linear Bushing

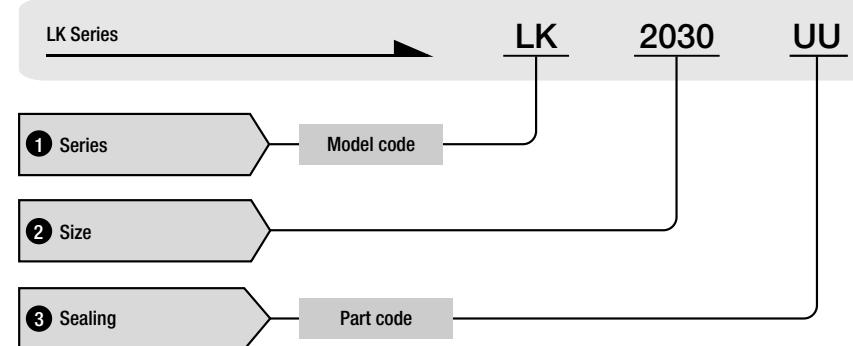

LK

IKO Compact Linear Bushing is a linear motion rolling guide, incorporating steel balls and a retainer compactly in an external cylinder which is made from a thin special-steel plate by precision drawing, carburizing and quenching.

IKO Compact Linear Bushing can be used to greatly reduce the size and weight of linear motion part of machines, because its sectional height is as small as 4 to 5mm and it is mounted directly on the shaft which is used as the raceway. Steel balls are guided accurately by the retainer, so frictional resistance is small and a highly accurate linear motion can be obtained.

IKO Compact Linear Bushing is tightly fitted in the housing bore with an interference, so it is not necessary to fix it axially and handling is easy.

Identification Number

Raceway surface

Since the shaft surface is used as a raceway for Compact Linear Bushing, the shaft must be heat-treated and ground. Recommended surface hardness and roughness of the shaft are shown in Table 1.

Table 1 Surface hardness and roughness of shaft

Item	Recommended value
Surface hardness	HRC58~64
Surface roughness ⁽¹⁾	0.2μmRa or less (0.8μmRy or less)

Note⁽¹⁾ : In case high accuracy is not required , 0.8μmRa(3.2μmRy) can be used.

Standard type : LK

Standard type : LK…UU

Structure of Compact Linear Bushing

Fit

The correct dimensions and accuracy IKO Compact Linear Bushing are obtained only after it has been press-fitted into the housing bore. As the external cylinder is thin, accuracy is directly affected by the dimensions, shape and rigidity of housing, so these factors must be examined carefully.

The recommended fit is shown in Table 2.

Table 2 Recommended fit

Housing material	Tolerance class of shaft		Tolerance class of housing bore	
	Normal clearance	Closer clearance	Normal clearance	Closer clearance
Steel, Cast iron	h 6	j 5	H 7	H 6
Light alloy	h 6	j 5	K 7	K 6

Mounting

IKO Compact Linear Bushing should be press-fitted into the housing gently, using an appropriate tool as shown in Fig.1 with its marked and face up. As the external cylinder is thin, it must never be stuck directly with a hammer.

Since the external cylinder of IKO Compact Linear Bushing is firmly press-fitted into the housing bore, it is not necessary to fix it axially.

Miniature Linear Bushing

LMS

IKO Miniature Linear Bushing is a miniature type linear motion rolling guide which travels along a shaft to achieve endless linear motion. The shaft diameter is 3~5 mm. In the external cylinder of Miniature Linear Bushing, a retainer, steel balls and stop rings are compactly incorporated, and precise positioning accuracy can be obtained.

Low frictional linear motion

Steel balls are accurately guided by a retainer, so low frictional resistance and stable linear motion can be achieved.

Compact design

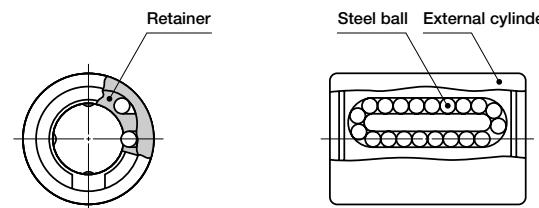

Miniature Linear Bushing is very small in size, allowing for compact assembly in machines and equipment.

Wide variations

In addition to the standard type, the high-rigidity long type is available. These types can be selected to suit the requirements in applications.

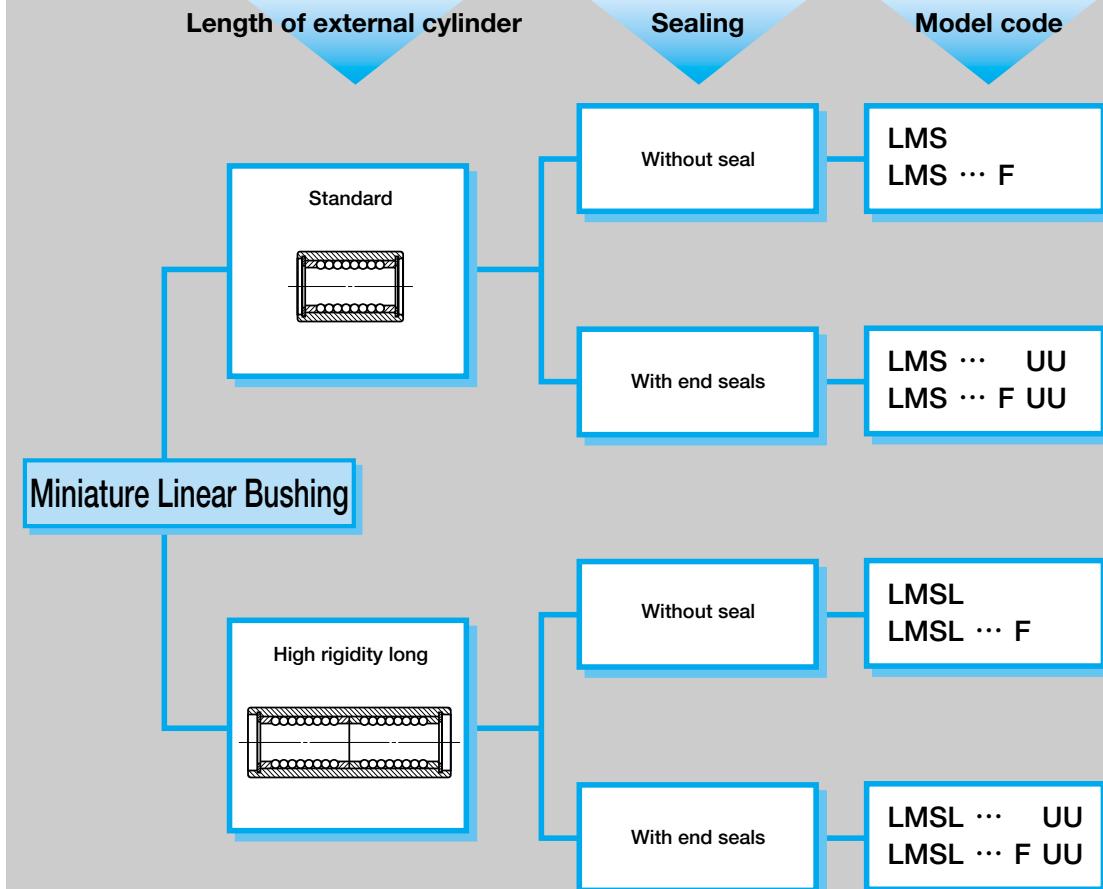

Stainless steel type

Miniature Linear Bushings made of stainless steel are also available. This type is suitable for applications where corrosion resistance is important.

Structure of Miniature Linear Bushing

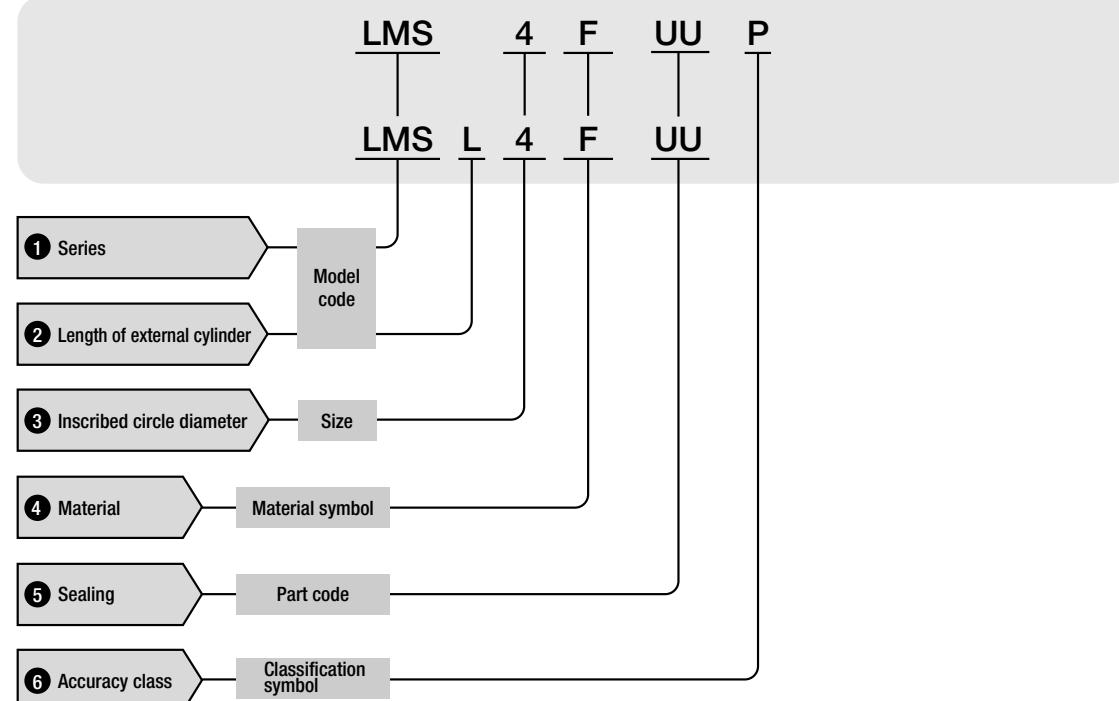

Miniature Linear Bushing series

Remark : "F" in the model codes indicates a stainless steel type.

Identification number and specification

The specification of Miniature Linear Bushing is indicated by the identification number, consisting of a model code, a size, a material symbol, a part code and a classification symbol.

- 1 Series** LMS
- 2 Length of external cylinder**
Standard : No symbol
High rigidity long : L
- 3 Inscribed circle diameter**
Indicate the inscribed circle diameter in mm.
- 4 Material**
High carbon steel made : No symbol
Stainless steel made : F
Specify the component part material.
- 5 Sealing**
Without seal : No symbol
With two end seals : UU
Sealed type incorporates seals with superior dust protection performance in both ends of the external cylinder for preventing intrusion of foreign matter.
- 6 Accuracy class**
For details of accuracy, see the table of dimensions on page E-185. The precision class is applicable to standard type only.
High Precision : No symbol
When strict control of radial internal clearance is required, specially controlled products of which inscribed circle diameter is selected within the divisions of every 0.002 mm can be delivered. If required, consult IKO.
